# WatchWithMe - Idea Conceptualization

# WatchWithMe: Idea Conceptualization Breakdown

**Prepared by:** Gideon **Last updated:** August 28, 2026

## The idea, in brief

> *WatchWithMe is a co-viewing accountability platform where diasporas, couples, friends, and work partners watch content together via a private link, with reminders, notes, and chat. A built-in AI model detects give cues in content and turns them into a tap-to-pay button, connecting viewers directly to creators' Payaza Give accounts.*

## Why this is the solution

> *People give more when they're together — that's why churches raise more in person than online; the presence of others lowers the barrier to give. WatchWithMe recreates that "room effect" for diasporas, couples, friends, and work partners by bringing them together to watch instead of consuming content alone. Inside that shared moment, an AI model detects give cues — a QR code, a spoken prompt, a give link — and turns them into a tap-to-pay button, connecting givers directly to the creator's Payaza Give account without leaving the platform. WatchWithMe builds the room; Payaza securely moves the money.*

## 1. Lived problem

The idea began with a personal, specific frustration: struggling to stay awake for a 6am prayer stream, alone, in the diaspora. That single experience revealed a wider pattern once examined closely:

- A friend accountability streak around a podcast (*The Diary of a CEO*) that felt flat and sleep-inducing when watched solo, but valuable with a friend.
- Long-form videos assigned by a boss that went unwatched — not because the content lacked value, but because there was no one to watch them *with*.

**The pattern:** the content was never the problem. The isolation around consuming it was.

## 2. Core insight — the "room effect"

The deeper insight goes beyond consistency. It's about *why people give*:

> *People give more in a room full of others giving than they do alone, scrolling past a QR code.*

This is a well-documented behavioral pattern — social proof and visible communal generosity lower the psychological barrier to give. It's why in-person church offerings consistently outperform online giving. WatchWithMe's core bet is that this "room effect" can be recreated digitally: **bring people together around content, and both accountability and generosity increase as a natural side effect.**

## 3. Concept

WatchWithMe is a private, link-based "space" where a small group — diaspora members, couples, friends, or work partners — watches something together, synced in real time, with light structure around the experience: reminders,

notes, and accountability tracking.

It is deliberately **not**: - A content-hosting platform (it doesn't host original video). - A video-calling platform (video/audio is a feature within a space, not the product itself).

It **is** the connective layer between existing content, the people who want to consume it together, and — increasingly — the ability to support the creator of that content without breaking the moment.

## 4. Who it's built for

| Audience | The gap WatchWithMe closes |
|---|---|
| **Diasporas** | Distance from home communities, church groups, or family traditions; time-zone isolation |
| **Couples** | Shared rituals and check-ins (devotion, learning, planning) even when schedules or locations don't naturally align |
| **Friends** | Turning solo, easily-abandoned habits (podcasts, courses, documentaries) into shared, sustained ones |
| **Work partners** | Structured co-learning — assigned videos, courses, or professional development content that's easy to defer when done alone |

## 5. Product pillars

| Pillar | What it does | Why it exists |
|---|---|---|
| **Watch** | Synced co-viewing board, unique space link | Solves "watching alone" |
| **Track** | Reminders + notepad + attendance/streaks | Solves "I forget / I don't finish" |
| **Connect** | Chat + optional video/audio | Solves "it still feels lonely even when scheduled" |
| **Give** | AI-detected give cues → tap-to-pay via Payaza | Solves "giving requires leaving the moment" |

## 6. How the AI + Payaza connection works

The giving layer is the direct product expression of the "room effect" insight — turning shared attention into completed, frictionless support for creators.

**Step 1 — Creator registration (one-time setup)** A creator, church, podcaster, or mentor links their existing Payaza Give account to their WatchWithMe profile or space. WatchWithMe stores a reference to that account — never the creator's funds or banking details directly.

**Step 2 — People come together** A space is created and content plays, synced, for everyone present. This is where the "room effect" happens — people see each other present and engaged, which is the exact condition under which giving becomes more natural.

**Step 3 — The AI model detects the give cue** While content plays, a purpose-built AI model scans for a give signal: a QR code on screen, a spoken give-prompt, or a give-link in text. Because the creator's account was already registered in Step 1, the detected cue is matched by lookup, not guesswork.

**Step 4 — Tap-to-pay** A tap-to-pay button appears directly inside the platform. A viewer taps it — no leaving the video, no app-switching, no manually scanning anything.

**Step 5 — Settlement through Payaza** The transaction routes through Payaza's existing rails. Payaza handles currency conversion and settles funds directly to the creator. WatchWithMe triggers the transaction; it never touches or holds the money itself.

> ***In one line:*** *WatchWithMe builds the room where people gather and get moved to give. Payaza is the secure rail that moves the money once they do.*

## 7. Outcome

- A viewer who used to sleep through devotion alone now shows up consistently, because friends are watching too.
- A couple, a friend group, or a work team builds a shared habit around content that matters to them — instead of quietly letting it lapse.
- A creator who used to rely on a QR code slide now receives support in the exact moment a viewer is moved — in any currency, without friction.
- A secondary effect: intentional, shared, trackable content consumption becomes a healthier substitute for passive social media scrolling.
